Blurred image recognition by Legendre moment invariants

H. Zhang, H.Z. Shu, Senior Member, IEEE, G.N. Han, G. Coatrieux, Member, IEEE, L.M. Luo, Senior Member, IEEE, J.L. Coatrieux, Fellow, IEEE

Abstract—**Processing blurred images is a key problem in many image applications. Existing methods to obtain blur invariants which are invariant with respect to centrally symmetric blur are based on geometric moments or complex moments. In this paper, we propose a new method to construct a set of blur invariants using the orthogonal Legendre moments. Some important properties of Legendre moments for the blurred image are presented and proved. The performance of the proposed descriptors is evaluated with various point-spread functions and different image noises. The comparison of the present approach with previous methods in terms of pattern recognition accuracy is also provided. The experimental results show that the proposed descriptors are more robust to noise and have better discriminative power than the methods based on geometric or complex moments.**

Index Terms—**Legendre moments, symmetric blur, blur invariants, blurred image, pattern recognition**

I. INTRODUCTION

Image processing is a very active area that has impacts in many domains from remote sensing, robotics, traffic surveillance to medicine. Automatic target recognition and tracking, character recognition, three-dimensional (3-D) scene analysis and reconstruction are only a few objectives to deal with. Since the real sensing systems are usually imperfect and the environmental conditions are changing over time, the acquired images often provide a degraded version of the true scene. An important class of degradations we are faced with in practice is image blurring, which can be caused by diffraction, lens aberration, wrong focus, and atmospheric turbulence. In pattern recognition, two options have been widely explored either through a two steps approach by restoring the image and then applying recognition methods, or by designing a direct one-step solution, free of blurring effects. In the former case, the point spread function (PSF), most often unknown in real applications, should be estimated [1-5]. In the latter case, finding a set of invariants that are not affected by blurring is the key problem and the subject of this paper.

The pioneering work in this field was performed by Flusser and Suk [6] who derived invariants to convolution with an arbitrary centrosymmetric PSF. These invariants have been successfully used in template matching of satellite images [6], in pattern recognition [7]-[10], in blurred digit and character recognition [11], [12], in normalizing blurred images into canonical forms [13], [14], and in focus/defocus quantitative measurement [15]. More recently, Flusser and Zitova introduced the combined blur-rotation invariants [16] and reported their successful application to satellite image registration [17] and camera motion estimation [18]. Suk and Flusser further proposed a set of combined invariants which are invariant to affine transform and to blur [19]. The extension of blur invariants to *N*-dimensions has also been investigated [20], [21]. All the existing methods to derive the blur invariants are based on geometric moments or complex moments. However, both geometric moments and complex moments contain redundant information and are sensitive to noise especially when high-order moments are concerned. This is due to the fact that the kernel polynomials are not orthogonal.

Teague has suggested the use of orthogonal moments to recover the image from moments [22]. It was shown that the orthogonal moments are better than other types of moments in terms of information redundancy, and are more robust to noise [23]. As noted by Teh and Chin [23], the moment invariants are considered reliable features in pattern recognition if they are insensitive to the presence of image noise. Consequently, it could be expected that the use of orthogonal moments in the construction of blur invariant provides better recognition results. To the authors' knowledge, no orthogonal moments have been used to construct the blur invariants.

In this paper, we propose a new method to derive a set of blur invariants based on orthogonal Legendre moments (for a recent survey on moments, refer to [24]-[27]). The organization of this paper is as follows: in Section 2, we review the theory of blur invariants of geometric moments and the definition of Legendre moments. In Section 3, we establish a relationship between the Legendre moments of the blurred image and those of the original image and the PSF. Based on this relationship, a

set of blur invariants using Legendre moments is provided. The experimental results for evaluating the performance of the proposed descriptors are given in Section 4. Finally, some concluding remarks are provided.

II. BLUR INVARIANTS AND LEGENDRE MOMENTS

This section first reviews the theory of blur invariants of geometric moments proposed by Flusser and Suk [6], [7], and then presents some basic definitions of Legendre moments.

A. Blur invariants of geometric moments

The two-dimensional (2-D) geometric moment of order $(p+q)$, with image intensity function $f(x, y)$, is defined as

$$m_{pq}^{(f)} = \int_{-1}^{1}\int_{-1}^{1} x^p y^q f(x,y)dxdy , \qquad (1)$$

where, without loss of generality, we assume that the image function $f(x, y)$ is defined on the square $[-1, 1] \times [-1, 1]$.

The corresponding central moment of image $f(x, y)$ is defined as

$$\mu_{pq}^{(f)} = \int_{-1}^{1}\int_{-1}^{1} (x-x_0^{(f)})^p (y-y_0^{(f)})^q f(x,y)dxdy , \qquad (2)$$

with the coordinates ($x_0^{(f)}$, $y_0^{(f)}$) denoting the centroid of $f(x, y)$

$$x_0^{(f)} = \frac{m_{10}^{(f)}}{m_{00}^{(f)}}, \quad y_0^{(f)} = \frac{m_{01}^{(f)}}{m_{00}^{(f)}} . \qquad (3)$$

Let $g(x, y)$ be a blurred version of the original image $f(x, y)$. The blurring is classically described by the convolution

$$g(x, y) = (f * h)(x, y) , \qquad (4)$$

where $h(x, y)$ is the PSF of the imaging system, and * denotes linear convolution.

In this paper, we assume that the PSF, $h(x, y)$, is a centrally symmetric image function and the imaging system is energy-preserving, that is,

$$h(x, y) = h(-x, -y) , \qquad (5)$$

$$\int_{-1}^{1}\int_{-1}^{1} h(x,y)dxdy = 1 . \qquad (6)$$

As noted by Flusser [7], the assumption of centrally symmetry is not a significant limitation of practical utilization of the method. Most real sensors and imaging systems have PSFs with certain degrees of symmetry. In many cases they have even higher symmetry than central, such as axial or radial symmetry. Thus, the central symmetry assumption is general enough to describe almost all practical situations.

Lemma 1. The centroid of the blurred image $g(x, y)$ is related to the centroid of the original image $f(x, y)$ and that of the PSF $h(x, y)$ as

$$\begin{aligned} x_0^{(g)} &= x_0^{(f)} + x_0^{(h)}, \\ y_0^{(g)} &= y_0^{(f)} + y_0^{(h)}. \end{aligned} \qquad (7)$$

In particular, if $h(x, y)$ is centrally symmetric, then $x_0^{(h)} = y_0^{(h)} = 0$. In such a case, we have $x_0^{(g)} = x_0^{(f)}$, $y_0^{(g)} = y_0^{(f)}$.

The proof of Lemma 1 can be found in [9].

B. Legendre moments

The 2-D $(p+q)$th order Legendre moment of image function $f(x, y)$ is defined as [28]

$$L_{pq}^{(f)} = \int_{-1}^{1}\int_{-1}^{1} P_p(x)P_q(y)f(x,y)dxdy , p, q = 0, 1, 2, \ldots, \qquad (8)$$

where $P_p(x)$ is the pth-order orthonormal Legendre polynomials given by

$$P_p(x) = \sum_{k=0}^{p} c_{p,k}x^k , \qquad (9)$$

with

$$c_{p,k} = \begin{cases} \sqrt{\dfrac{2p+1}{2}}\dfrac{(-1)^{\frac{p-k}{2}}(p+k)!}{2^p\left(\dfrac{p-k}{2}\right)!\left(\dfrac{p+k}{2}\right)!k!}, & p-k = \text{even} \\ 0, & p-k = \text{odd} \end{cases} \qquad (10)$$

The corresponding central moments are defined as

$$\bar{L}_{pq}^{(f)} = \int_{-1}^{1}\int_{-1}^{1} P_p(x-x_0^{(f)})P_q(y-y_0^{(f)})f(x,y)dxdy, \qquad (11)$$

where the coordinates ($x_0^{(f)}$, $y_0^{(f)}$) are defined in (3).

III. METHOD

In this section, we first establish a relationship between the Legendre moments of the blurred image and those of the original image and the PSF. We then derive a set of blur moment invariants.

A. Legendre moments of the blurred image

The 2-D normalized Legendre moments of blurred image, $g(x, y)$, are defined by

$$\begin{aligned} L_{p,q}^{(g)} &= \int_{-1}^{1}\int_{-1}^{1} P_p(x)P_q(y)g(x,y)dxdy \\ &= \int_{-1}^{1}\int_{-1}^{1} P_p(x)P_q(y)(f*h)(x,y)dxdy \\ &= \int_{-1}^{1}\int_{-1}^{1} P_p(x)P_q(y)\left(\int_{-\infty}^{\infty}\int_{-\infty}^{\infty} h(a,b)f(x-a,y-b)dadb\right)dxdy \\ &= \int_{-1}^{1}\int_{-1}^{1} h(a,b)\left(\int_{-1}^{1}\int_{-1}^{1} P_p(x+a)P_q(y+b)f(x,y)dxdy\right)dadb. \end{aligned} \qquad (12)$$

In the rest of this subsection, we discuss how to express the Legendre moments of blurred image defined by (12) in terms of Legendre moments of the original image and the PSF.

Making the notation $U_M(x) = (P_0(x), P_1(x), \ldots, P_M(x))^T$ and $M_M(x) = (1, x, \ldots, x^M)^T$ where the superscript T indicates the vector transposition, we have

$$U_M(x) = C_M M_M(x) , \qquad (13)$$

where $C_M = (c_{p,k})$, with $0 \leq k \leq p \leq M$, is a $(M+1) \times (M+1)$ lower triangular matrix whose elements $c_{p,k}$ are given by (10).

Since all the diagonal elements of C_M, $c_{p,p} = \sqrt{\dfrac{2p+1}{2}}\dfrac{(2p)!}{2^p p!}$, are not zero, the matrix C_M is non-singular, thus

$$M_M(x) = (C_M)^{-1}U_M(x) = D_M U_M(x) , \qquad (14)$$

where $D_M = (d_{p,k})$, with $0 \leq k \leq p \leq M$, is the inverse matrix of C_M. The elements of D_M are given by [29]

$$d_{p,k} = \begin{cases} \sqrt{\dfrac{2}{2k+1}}\dfrac{2^{\frac{3k-p}{2}}}{\left(\dfrac{p-k}{2}\right)!\prod_{j=1}^{(p-k)/2}(2k+2j+1)}\dfrac{p!k!}{(2k)!}, & p-k = \text{even} \\ 0, & p-k = \text{odd} \end{cases} \qquad (15)$$

By expanding (14), we obtain

$$x^k = \sum_{i=0}^{k} d_{k,i} P_i(x) .\tag{16}$$

Similarly,

$$a^m = \sum_{s=0}^{m} d_{m,s} P_s(a) .\tag{17}$$

Replacing the variable x by $x+a$ in (9), we have

$$P_p(x+a) = \sum_{m=0}^{p} c_{p,m}(x+a)^m = \sum_{m=0}^{p}\sum_{k=0}^{m}\binom{m}{k} c_{p,m} x^k a^{m-k} .\tag{18}$$

Substitution of (16) and (17) into (18) yields

$$\begin{aligned}
P_p(x+a) &= \sum_{m=0}^{p}\sum_{k=0}^{m}\binom{m}{k} c_{p,m}\sum_{i=0}^{k} d_{k,i} P_i(x)\sum_{s=0}^{m-k} d_{m-k,s} P_s(a)\\
&= \sum_{m=0}^{p}\sum_{k=0}^{m}\sum_{i=0}^{k}\sum_{s=0}^{m-k}\binom{m}{k} c_{p,m} d_{k,i} d_{m-k,s} P_i(x)P_s(a)\\
&= \sum_{i=0}^{p}\sum_{k=i}^{p}\sum_{m=k}^{p}\sum_{s=0}^{m-k}\binom{m}{k} c_{p,m} d_{k,i} d_{m-k,s} P_i(x)P_s(a).
\end{aligned}\tag{19}$$

Similarly, we have

$$P_q(y+b) = \sum_{j=0}^{q}\sum_{l=j}^{q}\sum_{n=l}^{q}\sum_{t=0}^{n-l}\binom{n}{l} c_{q,n} d_{l,j} d_{n-l,t} P_j(y)P_t(b) .\tag{20}$$

The following theorem reveals the relationship between the Legendre moments of the blurred image and those of the original image and the PSF.

Theorem 1. Let $f(x, y)$ be the original image function and the PSF $h(x, y)$ be an arbitrary image function, and $g(x, y)$ be a blurred version of $f(x, y)$, then the relations

$$L_{p,q}^{(g)} = \sum_{i=0}^{p}\sum_{j=0}^{q} L_{i,j}^{(f)}\sum_{s=0}^{p-i}\sum_{t=0}^{q-j} L_{s,t}^{(h)}\sum_{k=i}^{p-s}\sum_{m=k+s}^{p}\sum_{l=j}^{q-t}\sum_{n=l+t}^{q}\binom{m}{k}\binom{n}{l} c_{p,m} c_{q,n} d_{k,i} d_{m-k,s} d_{l,j} d_{n-l,t} ,\tag{21}$$

and

$$\bar{L}_{p,q}^{(g)} = \sum_{i=0}^{p}\sum_{j=0}^{q} \bar{L}_{i,j}^{(f)}\sum_{s=0}^{p-i}\sum_{t=0}^{q-j} \bar{L}_{s,t}^{(h)}\sum_{k=i}^{p-s}\sum_{m=k+s}^{p}\sum_{l=j}^{q-t}\sum_{n=l+t}^{q}\binom{m}{k}\binom{n}{l} c_{p,m} c_{q,n} d_{k,i} d_{m-k,s} d_{l,j} d_{n-l,t} .\tag{22}$$

hold for every p and q.

Proof. Substituting (19) and (20) into (12), we have

$$\begin{aligned}
L_{p,q}^{(g)} =& \int_{-1}^{1}\int_{-1}^{1} h(a,b)\left(\int_{-1}^{1}\int_{-1}^{1}\left(\sum_{i=0}^{p}\sum_{k=i}^{p}\sum_{m=k}^{p}\sum_{s=0}^{m-k}\binom{m}{k} c_{p,m} d_{k,i} d_{m-k,s} P_i(x)P_s(a)\right)\right.\\
&\left.\times\left(\sum_{j=0}^{q}\sum_{l=j}^{q}\sum_{n=l}^{q}\sum_{t=0}^{n-l}\binom{n}{l} c_{q,n} d_{l,j} d_{n-l,t} P_j(y)P_t(b)\right) f(x,y)dxdy\right)dadb.
\end{aligned}\tag{23}$$

The above equation can be rewritten as

$$\begin{aligned}
L_{p,q}^{(g)} &= \sum_{i=0}^{p}\sum_{k=i}^{p}\sum_{m=k}^{p}\sum_{s=0}^{m-k}\sum_{j=0}^{q}\sum_{l=j}^{q}\sum_{n=l}^{q}\sum_{t=0}^{n-l}\binom{m}{k}\binom{n}{l} c_{p,m} d_{m-k,s} d_{k,i} c_{q,n} d_{n-l,t} d_{l,j} L_{i,j}^{f} L_{s,t}^{h}\\
&= \sum_{i=0}^{p}\sum_{j=0}^{q} L_{i,j}^{(f)}\sum_{s=0}^{p-i}\sum_{t=0}^{q-j} L_{s,t}^{(h)}\sum_{k=i}^{p-s}\sum_{m=k+s}^{p}\sum_{l=j}^{q-t}\sum_{n=l+t}^{q}\binom{m}{k}\binom{n}{l} c_{p,m} c_{q,n} d_{k,i} d_{m-k,s} d_{l,j} d_{n-l,t}.
\end{aligned}\tag{24}$$

The proof of (21) is now complete. The proof of (22) is very similar to that of (21), it is omitted here.   □

Theorem 2. If $h(x, y)$ satisfies the conditions of central symmetry, then

(a) $L_{p,q}^{(h)} = \bar{L}_{p,q}^{(h)}$ for every p and q;

(b) If $(p+q)$ is odd, then $\bar{L}_{p,q}^{(h)} = 0$.

Proof. Using Lemma 1, the assertion of (a) can be easily proven. To demonstrate (b), it is noticed that $P_p(-x) = (-1)^p P_p(x)$. Using this relationship, we can deduce the result.   □

B.   Blur invariants of Legendre moments

With the help of Theorems 1 and 2, we are now ready to construct a set of blur invariants of Legendre moments through the following theorem.

Theorem 3. Let $f(x, y)$ be an image function. Let us define the following function $I^{(f)} : \mathbf{N}\times\mathbf{N}\rightarrow\mathbf{R}.$

If $(p+q)$ is even then

$$I(p,q)^{(f)} = 0$$

If $(p+q)$ is odd then

$$I(p,q)^{(f)} = L_{p,q}^{(f)} - \frac{1}{2L_{0,0}^{(f)}}\sum_{i=0}^{p}\sum_{\substack{j=0\\0<i+j<p+q}}^{q} I(i,j)^{(f)}\sum_{s=0}^{p-i}\sum_{t=0}^{q-j} L_{s,t}^{(f)}\sum_{k=i}^{p-s}\sum_{m=k+s}^{p}\sum_{l=j}^{q-t}\sum_{n=l+t}^{q}\binom{m}{k}\binom{n}{l} c_{p,m} c_{q,n} d_{k,i} d_{m-k,s} d_{l,j} d_{n-l,t}.\tag{25}$$

Then, $I(p, q)$ is invariant to centrally symmetric blur for any p and q. The number $p+q$ is called the order of the invariant.

The proof of Theorem 3 is given in Appendix A.

Using the Legendre central moments instead of Legendre moments, we can obtain a set of invariants to translation and to blur which are formally similar to $I(p,q)^{(f)}$.

Theorem 4. Let $f(x, y)$ be an image function. Let us define the following function $\bar{I}^{(f)} : \mathbf{N}\times\mathbf{N}\rightarrow\mathbf{R}.$

If $(p+q)$ is even then

$$\bar{I}(p,q)^{(f)} = 0 .$$

If $(p+q)$ is odd then

$$\bar{I}(p,q)^{(f)} = \bar{L}_{p,q}^{(f)} - \frac{1}{2\bar{L}_{0,0}^{(f)}}\sum_{i=0}^{p}\sum_{\substack{j=0\\0<i+j<p+q}}^{q} \bar{I}(i,j)^{(f)}\sum_{s=0}^{p-i}\sum_{t=0}^{q-j} \bar{L}_{s,t}^{(f)}\sum_{k=i}^{p-s}\sum_{m=k+s}^{p}\sum_{l=j}^{q-t}\sum_{n=l+t}^{q}\binom{m}{k}\binom{n}{l} c_{p,m} c_{q,n} d_{k,i} d_{m-k,s} d_{l,j} d_{n-l,t}.\tag{26}$$

Then, $\bar{I}(p,q)$ is invariant to centrally symmetric blur and to translation for any p and q.

The proof of Theorem 4 is very similar to that of Theorem 3, it is thus omitted here. It should be noted that $\bar{I}(p,q)$ in (26) deals with translation of both the image and the PSF.

Based on (26), we can construct a set of blur and translation invariants of Legendre moments and express them in explicit form. The invariants of the third, fifth and seventh orders are listed in Appendix B.

IV.   EXPERIMENTAL RESULTS

In this section, some experiments are described in order to show the invariance of the proposed method to various PSF's and its robustness to different kinds of noise. The comparison with some existing methods in terms of recognition accuracy is also provided.

A.   Test of invariance and robustness to noise

A toy cat image, whose size is 128×128 (Fig. 1), has been chosen from the public Columbia database [30]. This image was then successively degraded by out-of-focus blur, averaging mask, Gaussian function and motion filter as reported in [8], [9] and [19]. The parameter σ (standard deviation of the Gaussian function) of Gaussian blur was

chosen equal to 0.5, and the parameter θ (θ means the angle in the counterclockwise direction, $\theta = 0$ corresponds to a horizontal motion, and $\theta = \pi/2$ corresponds to a vertical motion.) of motion blur set to 0. Other parameters such as the size for averaging blur, the radius for out-of-focus and the depth for motion filter were chosen equal to the size of blur mask in all the experiments. We first checked that the eighteen Legendre moment invariants of order up to seven (listed in Appendix B) were exactly equal to those of the original image whatever the blurring mode (the corresponding numerical values are omitted here).

Let us define the vectors $\hat{I}_r = (\overline{I}(0,r), \overline{I}(1,r-1), ..., \overline{I}(r,0))$ and $\tilde{I}(r) = (\hat{I}_3, \hat{I}_5, ..., \hat{I}_r)$ for any odd value of $r \geq 3$. The relative error between the two images is computed by

$$E_r(f,g) = \frac{\left\| \tilde{I}^{(f)}(r) - \tilde{I}^{(g)}(r) \right\|}{\left\| \tilde{I}^{(f)}(r) \right\|}, \tag{27}$$

where $\|.\|$ is Euclidean norm in L^2 space. In the following experiments, moment invariants of order up to $r = 7$ are used.

The next experiment was carried out to verify the performance of the invariants to both image blur and noise. The original cat image was blurred by a 9×9 averaging mask and a zero-mean Gaussian noise with standard deviation (STD) from 1 to 50 was added. Some examples of the blurred image with additive Gaussian noise or salt-and-pepper noise are shown in Fig. 2. Plots in Fig. 3 compare the relative error defined by (27) for Flusser's method based on geometric moment invariants (GMI) where eighteen blur invariants derived from central moments are used [7], the complex moment invariants (CMI) reported in [16] and the present Legendre moment invariants (LMI) up to order seven by averaging blur with different Gaussian noises. It can be seen from the figure that the proposed descriptors perform better than the GMI and CMI. Then, the cat image was blurred by a 11×11 motion filter, and the same Gaussian noise was added. The results (Fig. 4) again indicate the better behavior of the proposed method. Similarly, the original cat image was degraded on one hand by out-of-focus blur (13 pixel-radius of the PSF support) and by adding a salt-and-pepper noise with noise densities varying from 0.004 to 0.2 (see Fig. 5) and, on another hand, by Gaussian blur (the PSF was a Gaussian function with 15 pixel-radius of support) with the same salt-and-pepper noise (see Fig. 6). It can be also seen that a better robustness is achieved whatever the PSF or the additive noises.

B. Classification results

This experiment was carried out to compare the discrimination power of the GMI, CMI and LMI. A set of alphanumeric characters whose size is 50×50 pixels (Fig. 7) is used for the recognition task. The reason for choosing such a character set is that the elements in subset {0, o}, {2, Z}, {7, T} and {9, q} can be easily misclassified due to their similarity. The testing set is generated by adding averaging blur, out-of-focus blur, Gaussian blur and motion blur with mask of sizes 3×3, 4×4, 5×5, 6×6, 7×7, 8×8, 9×9, 10×10, 11×11, 12×12 pixels, respectively. The parameter σ of Gaussian blur was chosen equal to 1 or 2, and the parameter θ of motion blur set to

0 or 1, forming a set of 480 images. Note that the original images as well as the blurred images are mapped onto the area of orthogonality, and the actual size of the blurred images in this experiment is 80×80. This is followed by adding a white Gaussian noise with different standard deviations, salt-and-pepper noise with different noise densities and multiplicative noise with different noise densities. The Euclidean distance is used here as the classification measure. Table 1 shows the classification rates using the different moment invariants. One can observe from this table that the recognition results are quite good for the different methods in the noise-free case. The classification rates remain high for low and moderate noise levels but decrease significantly when the noise level goes up. However, if the GMI behaves better than the CMI, the LMI approach is the only one providing a rate close to or over 90% whatever the noise nature and its level.

In the next example, eight objects were selected from the Coil-100 image database of Columbia University as an original image set (see Fig. 8). The actual size of the blurred images in this experiment is 160×160. Fig. 9 shows some examples of the blurred and corrupted images. The recognition results are displayed in Table 2. They lead to the same conclusions regarding the performance of the respective moment invariants but the decrease in recognition rate is more significant when the noise level is increased. This is also true for the LMI. The CMI do not perform well in these experiments due to their additional invariance to rotation. The worse numerical stability is a tax on the combined invariance. The orthogonality of LMI explains the difference in performance with GMI.

We also compared the computational load of the GMI, CMI and LMI in these two experiments. The programs were implemented in MATLAB 6.5 on a PC P4 2.4 GHZ, 512M RAM. It can be seen from Tables 1 and 2 that the GMI and the LMI computations are much faster than the CMI ones. This is due to the fact that the computation of the complex moments requires a mapping transformation which is time consuming.

C. Real image analysis

In the last experiment, we tested the performance of the invariants on images degraded by real out-of-focus blur. A sequence of eight pictures of a comb lying on a black ground was taken by a digital camera (Panasonic DMC-FZ50). The images differ from each other by the level of out-of-focus blur. The picture was captured 8 times from the same position but with different focus depth, manually set. All the test images are depicted in Fig. 10. The values of GMI, CMI and LMI were computed for each image. Table 3 depicts the values of σ/μ, where μ denotes the mean of eight real images and σ the standard deviation. From this table, it can be seen that the minimal value of the LMI is 3.42% and the maximum value of the LMI is 6.15%, which are lower than those obtained with GMI (resp. 4.91%, 12.43%) and the CMI (resp. 7.47%, 7.54%).

V. CONCLUSION AND PERSPECTIVES

In this paper, we have proposed a new approach to derive a set of blur invariants using the orthogonal Legendre moments. The relationship between the Legendre moments of the blurred image and those of the original image and the PSF has been

established, and using this relationship, a set of blur invariants based on Legendre moments has been derived. The experiments conducted so far in very distinct situations demonstrated that the proposed descriptors are more robust to noise and have better discriminative power than the methods based on geometric or complex moments.

One weak point of these descriptors is that they are only invariant to translation, but not invariant under image scaling and rotation. The derivation of combined invariants to both geometric transformation and blur is currently under investigation.

APPENDIX A

The theoretical derivations provided here allow getting the expressions of the Legendre invariants to translation and blur. To prove Theorem 3, we need first the following Lemma.

Lemma 2 Let p, i, j and t be given integers satisfying $0 \leq i \leq p-1$, $0 \leq j \leq p-i-1$, $0 \leq t \leq p-i-j$, let us define

$$F(p,i,j,t) = \sum_{s=i+j}^{p-t} \sum_{l=i}^{s-j} \sum_{n=l+j}^{s} \sum_{k=s}^{p-t} \sum_{m=k+t}^{p} \binom{n}{l}\binom{m}{k} c_{s,n} d_{l,i} d_{n-l,j} c_{p,m} d_{k,s} d_{m-k,t},$$

(A1)

$$G(p,i,j,t) = \sum_{s=j+t}^{p-i} \sum_{l=j}^{s-t} \sum_{n=l+t}^{s} \sum_{k=i}^{p-s} \sum_{m=k+s}^{p} \binom{n}{l}\binom{m}{k} c_{s,n} d_{l,j} d_{n-l,t} c_{p,m} d_{k,i} d_{m-k,s},$$

(A2)

where the coefficients $c_{i,j}$ and $d_{m,n}$ are respectively given by (10) and (15), then we have $F(p, i, j, t) = G(p, i, j, t)$.

Proof: By changing the order of summation in (A1), we have

$$F(p,i,j,t) = \sum_{m=0}^{p} c_{p,m} \sum_{l=0}^{p-t-j} \sum_{n=0}^{p-t} \sum_{k=0}^{p-t} \sum_{s=0}^{p-t} \binom{m}{k}\binom{n}{l} c_{s,n} d_{l,i} d_{n-l,j} d_{k,s} d_{m-k,t}$$

$$= \sum_{m=0}^{p} c_{p,m} F_1(p,m,i,j,t),$$

(A3)

where

$$F_1(p,m,i,j,t) = \sum_{l=0}^{p-t-j} \sum_{n=0}^{p-t} \sum_{k=0}^{p-t} \sum_{s=0}^{p-t} \binom{m}{k}\binom{n}{l} c_{s,n} d_{l,i} d_{n-l,j} d_{k,s} d_{m-k,t}.$$

(A4)

Similarly, (A2) can be written as

$$G(p,i,j,t) = \sum_{m=0}^{p} c_{p,m} \sum_{l=0}^{p-t-i} \sum_{n=0}^{p-i} \sum_{k=0}^{p} \sum_{s=0}^{p-i} \binom{m}{k}\binom{n}{l} c_{s,n} d_{l,j} d_{n-l,t} d_{k,i} d_{m-k,s}$$

$$= \sum_{m=0}^{p} c_{p,m} G_1(p,m,i,j,t),$$

(A5)

where

$$G_1(p,m,i,j,t) = \sum_{l=0}^{p-t-i} \sum_{n=0}^{p-i} \sum_{k=0}^{p} \sum_{s=0}^{p-i} \binom{m}{k}\binom{n}{l} c_{s,n} d_{l,j} d_{n-l,t} d_{k,i} d_{m-k,s}.$$

(A6)

To prove the Lemma, it suffices to prove $F_1(p,m,i,j,t) = G_1(p,m,i,j,t)$. Since both $C_M = (c_{i,j})$ and D_M

$= (d_{i,j})$ are lower triangular matrices, it is clear that $d_{k,s}=0$ if $s > k$, and $c_{s,n} = 0$ if $n > s$. Using these properties and changing the order of summation in (A4) and (A6), we have

$$F_1(p,m,i,j,t) = \sum_{k=0}^{m} \sum_{s=0}^{k} \sum_{n=0}^{s} \sum_{l=0}^{n} \binom{m}{k}\binom{n}{l} c_{s,n} d_{l,i} d_{n-l,j} d_{k,s} d_{m-k,t},$$ (A7)

$$G_1(p,m,i,j,t) = \sum_{k=0}^{m} \sum_{s=0}^{m-k} \sum_{n=0}^{s} \sum_{l=0}^{n} \binom{m}{k}\binom{n}{l} c_{s,n} d_{l,j} d_{n-l,t} d_{k,i} d_{m-k,s}.$$ (A8)

(A7) can be further written as

$$F_1(p,m,i,j,t) = \sum_{k=0}^{+\infty} \sum_{s=0}^{+\infty} \sum_{n=0}^{+\infty} \sum_{l=0}^{+\infty} \binom{m}{k}\binom{n}{l} c_{s,n} d_{l,i} d_{n-l,j} d_{k,s} d_{m-k,t}$$

$$= \sum_{k=0}^{+\infty} \sum_{n=0}^{+\infty} \sum_{l=0}^{+\infty} \binom{m}{k}\binom{n}{l} d_{l,i} d_{n-l,j} d_{m-k,t} \sum_{s=0}^{+\infty} d_{k,s} c_{s,n},$$

(A9)

where the convention $\binom{m}{k}=0$ if $k > m$ is used in the above equation.

Since the matrix D_M is the inverse of C_M, we have $\sum_{s=0}^{+\infty} d_{k,s} c_{s,n} = \delta_{k,n}$, thus, (A9) becomes

$$F_1(p,m,i,j,t) = \sum_{k=0}^{+\infty} \sum_{l=0}^{+\infty} \binom{m}{k}\binom{k}{l} d_{l,i} d_{k-l,j} d_{m-k,t}$$

$$= \sum_{k=0}^{+\infty} \sum_{l=0}^{+\infty} \frac{m!}{l!(m-k)!(k-l)!} d_{l,i} d_{k-l,j} d_{m-k,t}.$$

(A10)

Letting $e_{u,v} = d_{u,v}/u!$, we have

$$F_1(p,m,i,j,t) = m! \sum_{k=0}^{+\infty} \sum_{l=0}^{+\infty} e_{l,i} e_{k-l,j} e_{m-k,t} = m! \sum_{k=0}^{+\infty} \sum_{l=0}^{+\infty} e_{m-k-l,j} e_{l,i} e_{k,t}.$$

(A11)

From the above equation, it can easily be obtained

$$F_1(p,m,i,t,j) = m! \sum_{k=0}^{+\infty} \sum_{l=0}^{+\infty} e_{m-k-l,i} e_{l,t} e_{k,j} = m! \sum_{k=0}^{+\infty} \sum_{l=0}^{+\infty} e_{m-k-l,i} e_{k,t} e_{l,j}$$

$$= F_1(p,m,i,j,t) \quad \text{(making the change of variables } k = l \text{ and } l = k)$$

(A12)

Making the change of variable $l = n - l$ in (A7), we can deduce

$$F_1(p,m,i,j,t) = F_1(p,m,j,i,t).$$ (A13)

Combining (A12) and (A13) and using (A7), we obtain

$$F_1(p,m,i,j,t) = F_1(p,m,j,t,i)$$

$$= \sum_{k=0}^{m} \sum_{s=0}^{k} \sum_{n=0}^{s} \sum_{l=0}^{n} \binom{m}{k}\binom{n}{l} c_{s,n} d_{l,j} d_{n-l,t} d_{k,s} d_{m-k,i}$$

$$= \sum_{k=0}^{m} \sum_{s=0}^{k} \sum_{n=0}^{s} \sum_{l=0}^{n} \binom{m}{m-k}\binom{n}{l} c_{s,n} d_{l,j} d_{n-l,t} d_{m-k,s} d_{k,i}$$

$$\text{(making the change of variable } k = m - k)$$

$$= \sum_{k=0}^{m} \sum_{s=0}^{k} \sum_{n=0}^{s} \sum_{l=0}^{n} \binom{m}{k}\binom{n}{l} c_{s,n} d_{l,j} d_{n-l,t} d_{k,i} d_{m-k,s}$$

$$= G_1(p,m,i,j,t)$$

(A14)

The proof of Lemma 2 is now complete. □

Proof of Theorem 3 We only need to prove the Theorem for the case where $p+q$ is odd. We will to do this by mathematical induction. It can be easily verified that the result is true for $p+q = 1$. For $p+q = 3$, four cases need to be considered: (1) ($p = 3$, $q = 0$); (2) ($p = 2$, $q = 1$); (3) ($p = 1$, $q = 2$); (4) ($p = 0$, $q = 3$). We provide here the demonstration for $p = 2$ and $q = 1$, other cases can be proved in a similar manner. We deduce from (25) that

$$I(2,1)^{(g)} =$$

$$L_{2,1}^{(g)} - \frac{1}{2L_{0,0}^{(g)}} \sum_{i=0}^{2} \sum_{\substack{j=0 \\ 0<i+j<3}}^{1} I(i,j)^{(g)} \sum_{s=0}^{2-i} \sum_{t=0}^{1-j} L_{s,t}^{(f)} \sum_{k=i}^{2-s} \sum_{m=k+s}^{2} \sum_{l=j}^{1-t} \sum_{n=l+t}^{1} \binom{m}{k}\binom{n}{l} c_{2,m} c_{1,n} d_{k,i} d_{m-k,s} d_{l,j} d_{n-l,t}$$

$$= L_{2,1}^{(g)} - \frac{1}{2L_{0,0}^{(g)}} \left\{ I(1,0)^{(g)} \sum_{s=0}^{1} \sum_{t=0}^{1} L_{s,t}^{(f)} \sum_{k=1}^{2-s} \sum_{m=k+s}^{2} \sum_{l=0}^{1-t} \sum_{n=l+t}^{1} \binom{m}{k}\binom{n}{l} c_{2,m} c_{1,n} d_{k,1} d_{m-k,s} d_{l,0} d_{n-l,t} \right.$$

$$\left. + I(0,1)^{(g)} \sum_{s=0}^{2} L_{s,0}^{(f)} \sum_{k=0}^{2-s} \sum_{m=k+s}^{2} \binom{m}{k} c_{2,m} c_{1,1} d_{k,0} d_{m-k,s} d_{1,1} d_{0,0} \right\}.$$

(A15)

Using Theorem 2, it can be obtained from (21) that

$$L_{0,0}^{(g)} = L_{0,0}^{(f)},$$

$$L_{1,0}^{(g)} = L_{1,0}^{(f)}, \quad L_{0,1}^{(g)} = L_{0,1}^{(f)},$$

$$L_{2,0}^{(g)} = L_{2,0}^{(f)} + 2L_{0,0}^{(f)} L_{2,0}^{(h)} + \sqrt{5} L_{0,0}^{(f)} L_{0,0}^{(h)}$$

$$L_{1,1}^{(g)} = L_{1,1}^{(f)} + 2L_{0,0}^{(f)} L_{1,1}^{(h)}$$

$$L_{2,1}^{(g)} = L_{2,1}^{(f)} + 2\sqrt{5} L_{1,0}^{(f)} L_{1,1}^{(h)} + 2L_{0,1}^{(f)} L_{2,0}^{(h)} + \sqrt{5} L_{0,1}^{(f)} L_{0,0}^{(h)}.$$

Substituting the above equations into (A15) and using the relationships $I(1,0)^{(g)} = I(1,0)^{(f)} = L_{1,0}^{(f)}$ and $I(0,1)^{(g)} = I(0,1)^{(f)} = L_{0,1}^{(f)}$, we have $I(2,1)^{(g)} = I(2,1)^{(f)}$.

Suppose that Theorem 3 is valid for all invariants of order up to $p+q-2$, then we get

$$I(p,q)^{(g)} - I(p,q)^{(f)}$$

$$= L_{p,q}^{(g)} - \frac{1}{2L_{0,0}^{(g)}} \sum_{i=0}^{p} \sum_{\substack{j=0 \\ i+j<p+q}}^{q} I(i,j)^{(g)} \sum_{s=0}^{p-i} \sum_{t=0}^{q-j} L_{s,t}^{(g)} \sum_{k=i}^{p-s} \sum_{m=k+s}^{p} \sum_{l=j}^{q-t} \sum_{n=l+t}^{q} \binom{m}{k}\binom{n}{l} c_{p,m} c_{q,n} d_{k,i} d_{m-k,s} d_{l,j} d_{n-l,t}$$

$$- L_{p,q}^{(f)} + \frac{1}{2L_{0,0}^{(f)}} \sum_{i=0}^{p} \sum_{\substack{j=0 \\ i+j<p+q}}^{q} I(i,j)^{(f)} \sum_{s=0}^{p-i} \sum_{t=0}^{q-j} L_{s,t}^{(f)} \sum_{k=i}^{p-s} \sum_{m=k+s}^{p} \sum_{l=j}^{q-t} \sum_{n=l+t}^{q} \binom{m}{k}\binom{n}{l} c_{p,m} c_{q,n} d_{k,i} d_{m-k,s} d_{l,j} d_{n-l,t}$$

$$= L_{p,q}^{(g)} - L_{p,q}^{(f)}$$

$$- \frac{1}{2L_{0,0}^{(f)}} \sum_{i=0}^{p} \sum_{\substack{j=0 \\ i+j<p+q}}^{q} I(i,j)^{(f)} \sum_{s=0}^{p-i} \sum_{t=0}^{q-j} (L_{s,t}^{(g)} - L_{s,t}^{(f)}) \sum_{k=i}^{p-s} \sum_{m=k+s}^{p} \sum_{l=j}^{q-t} \sum_{n=l+t}^{q} \binom{m}{k}\binom{n}{l} c_{p,m} c_{q,n} d_{k,i} d_{m-k,s} d_{l,j} d_{n-l,t}$$

(A16)

Using the property $(d_{0,0})^2 = 2$, equation (25) can be rewritten as

$$L_{p,q}^{(f)} = \frac{1}{2L_{0,0}^{(f)}} \sum_{i=0}^{p} \sum_{j=0}^{q} I(i,j)^{(f)} \sum_{s=0}^{p-i} \sum_{t=0}^{q-j} L_{s,t}^{(f)} \sum_{k=i}^{p-s} \sum_{m=k+s}^{p} \sum_{l=j}^{q-t} \sum_{n=l+t}^{q} \binom{m}{k}\binom{n}{l} c_{p,m} c_{q,n} d_{k,i} d_{m-k,s} d_{l,j} d_{n-l,t}.$$

(A17)

Using (21), we have

$$L_{p,q}^{(g)} - L_{p,q}^{(f)}$$

$$= \sum_{i=0}^{p} \sum_{j=0}^{q} L_{i,j}^{(f)} \sum_{s=0}^{p-i} \sum_{t=0}^{q-j} L_{s,t}^{(h)} \sum_{k=i}^{p-s} \sum_{m=k+s}^{p} \sum_{l=j}^{q-t} \sum_{n=l+t}^{q} \binom{m}{k}\binom{n}{l} c_{p,m} c_{q,n} d_{k,i} d_{m-k,s} d_{l,j} d_{n-l,t} - L_{p,q}^{(f)}$$

$$= \sum_{i=0}^{p} \sum_{\substack{j=0 \\ i+j<p+q}}^{q} L_{i,j}^{(f)} \sum_{s=0}^{p-i} \sum_{t=0}^{q-j} L_{s,t}^{(h)} \sum_{k=i}^{p-s} \sum_{m=k+s}^{p} \sum_{l=j}^{q-t} \sum_{n=l+t}^{q} \binom{m}{k}\binom{n}{l} c_{p,m} c_{q,n} d_{k,i} d_{m-k,s} d_{l,j} d_{n-l,t}$$

$$= \sum_{i=0}^{p} \sum_{\substack{j=0 \\ i+j<p+q}}^{q} L_{i,j}^{(f)} \sum_{s=0}^{p-i} \sum_{t=0}^{q-j} L_{s,t}^{(h)} A(p,q,i,j,s,t),$$

(A18)

where

$$A(p,q,i,j,s,t) = \sum_{k=i}^{p-s} \sum_{m=k+s}^{p} \sum_{l=j}^{q-t} \sum_{n=l+t}^{q} \binom{m}{k}\binom{n}{l} c_{p,m} c_{q,n} d_{k,i} d_{m-k,s} d_{l,j} d_{n-l,t}. \quad \text{(A19)}$$

Similarly

$$L_{s,t}^{(g)} - L_{s,t}^{(f)} = \sum_{i'=0}^{s} \sum_{\substack{j'=0 \\ i'+j'<s+t}}^{t} L_{i',j'}^{(f)} \sum_{s'=0}^{s-i'} \sum_{t'=0}^{t-j'} L_{s',t'}^{(h)} A(s,t,i',j',s',t'). \quad \text{(A20)}$$

Substituting (A18) and (A20) into (A16) and using (A17), we obtain

$$I(p,q)^{(g)} - I(p,q)^{(f)}$$

$$= \sum_{i=0}^{p} \sum_{\substack{j=0 \\ i+j<p+q}}^{q} L_{i,j}^{(f)} \sum_{s=0}^{p-i} \sum_{t=0}^{q-j} L_{s,t}^{(h)} A(p,q,i,j,s,t)$$

$$- \frac{1}{2L_{0,0}^{(f)}} \sum_{i=0}^{p} \sum_{\substack{j=0 \\ i+j<p+q}}^{q} I(i,j)^{(f)} \sum_{s=0}^{p-i} \sum_{t=0}^{q-j} \left[\sum_{i'=0}^{s} \sum_{\substack{j'=0 \\ i'+j'<s+t}}^{t} L_{i',j'}^{(f)} \sum_{s'=0}^{s-i'} \sum_{t'=0}^{t-j'} L_{s',t'}^{(h)} A(s,t,i',j',s',t') \right] A(p,q,i,j,s,t)$$

$$= \sum_{i=0}^{p} \sum_{\substack{j=0 \\ i+j<p+q}}^{q} \left[\frac{1}{2L_{0,0}^{(f)}} \sum_{i'=0}^{i} \sum_{j'=0}^{j} I(i',j')^{(f)} \sum_{s'=0}^{i-i'} \sum_{t'=0}^{j-j'} L_{s',t'}^{(h)} A(i,j,i',j',s',t') \right] \sum_{s=0}^{p-i} \sum_{t=0}^{q-j} L_{s,t}^{(h)} A(p,q,i,j,s,t)$$

$$- \frac{1}{2L_{0,0}^{(f)}} \sum_{i=0}^{p} \sum_{\substack{j=0 \\ i+j<p+q}}^{q} I(i,j)^{(f)} \sum_{s=0}^{p-i} \sum_{t=0}^{q-j} \left[\sum_{i'=0}^{s} \sum_{\substack{j'=0 \\ i'+j'<s+t}}^{t} L_{i',j'}^{(f)} \sum_{s'=0}^{s-i'} \sum_{t'=0}^{t-j'} L_{s',t'}^{(h)} A(s,t,i',j',s',t') \right] A(p,q,i,j,s,t)$$

$$= \frac{1}{2L_{0,0}^{(f)}} \sum_{i'=0}^{p} \sum_{\substack{j'=0 \\ i'+j'<p+q}}^{q} I(i',j')^{(f)} \sum_{i=i'}^{p} \sum_{j=j'}^{q} \sum_{s'=0}^{i-i'} \sum_{t'=0}^{j-j'} L_{s',t'}^{(f)} A(i,j,i',j',s',t') \sum_{s=0}^{p-i} \sum_{t=0}^{q-j} L_{s,t}^{(h)} A(p,q,i,j,s,t)$$

$$- \frac{1}{2L_{0,0}^{(f)}} \sum_{i=0}^{p} \sum_{\substack{j=0 \\ i+j<p+q}}^{q} I(i,j)^{(f)} \sum_{s=0}^{p-i} \sum_{t=0}^{q-j} \left[\sum_{i'=0}^{s} \sum_{\substack{j'=0 \\ i'+j'<s+t}}^{t} L_{i',j'}^{(f)} \sum_{s'=0}^{s-i'} \sum_{t'=0}^{t-j'} L_{s',t'}^{(h)} A(s,t,i',j',s',t') \right] A(p,q,i,j,s,t)$$

(A21)

Define

$$B(p,q) = \frac{1}{2L_{0,0}^{(f)}} \sum_{i'=0}^{p} \sum_{\substack{j'=0 \\ i'+j'<p+q}}^{q} I(i',j')^{(f)} \sum_{s'=0}^{p-i'} \sum_{t'=0}^{q-j'} L_{s',t'}^{(f)} L_{0,0}^{(h)} A(p,q,i',j',s',t') A(p,q,p,q,0,0)$$

$$= \frac{1}{2L_{0,0}^{(f)}} \sum_{i=0}^{p} \sum_{\substack{j=0 \\ i+j<p+q}}^{q} I(i,j)^{(f)} \sum_{s=0}^{p-i} \sum_{t=0}^{q-j} L_{s,t}^{(f)} L_{0,0}^{(h)} A(p,q,i,j,s,t) A(p,q,p,q,0,0)$$

(A22)

$$B'(p,q) = \frac{1}{2L_{0,0}^{(f)}} \sum_{i=0}^{p} \sum_{\substack{j=0 \\ i+j<p+q}}^{q} I(i,j)^{(f)} \sum_{s=0}^{p-i} \sum_{t=0}^{q-j} L_{s,t}^{(f)} L_{0,0}^{(h)} A(p,q,i,j,s,t) A(s,t,s,t,0,0),$$

(A23)

it can be easily verified from (A19) that $A(p,q,p,q,0,0) = A(s,t,s,t,0,0) = (d_{0,0})^2$, thus, we have $B(p,q) = B'(p,q)$. Using this relationship, (A21) can be rewritten as

$$I(p,q)^{(g)} - I(p,q)^{(f)}$$

$$= \frac{1}{2L_{0,0}^{(f)}} \sum_{i'=0}^{p} \sum_{\substack{j'=0 \\ i'+j'<p+q}}^{q} I(i',j')^{(f)} \sum_{i=i'}^{p} \sum_{j=j'}^{q} \sum_{s'=0}^{i-i'} \sum_{t'=0}^{j-j'} L_{s',t'}^{(f)} A(i,j,i',j',s',t') \sum_{s=0}^{p-i} \sum_{t=0}^{q-j} L_{s,t}^{(h)} A(p,q,i,j,s,t)$$

$$- \frac{1}{2L_{0,0}^{(f)}} \sum_{i=0}^{p} \sum_{\substack{j=0 \\ i+j<p+q}}^{q} I(i,j)^{(f)} \sum_{s=0}^{p-i} \sum_{t=0}^{q-j} \left[\sum_{i'=0}^{s} \sum_{j'=0}^{t} L_{i',j'}^{(f)} \sum_{s'=0}^{s-i'} \sum_{t'=0}^{t-j'} L_{s',t'}^{(h)} A(s,t,i',j',s',t') \right] A(p,q,i,j,s,t)$$

(A24)

Changing the order of summation and shifting the indices in the above equation, we obtain

$$I(p,q)^{(g)} - I(p,q)^{(f)}$$

$$= \frac{1}{2L_{0,0}^{(f)}} \sum_{\substack{i'=0 \\ i'+j'<p+q}}^{p} \sum_{j'=0}^{q} I(i',j')^{(f)} \sum_{s'=0}^{p-t} \sum_{t'=0}^{q-j'} L_{s',t'}^{(f)} \sum_{s=0}^{p-t'-s'} \sum_{t=0}^{q-j'-t'} L_{s,t}^{(h)} \sum_{i=i'+s'}^{p-s} \sum_{j=j'+t'}^{q-t} A(i,j,i',j',s',t') A(p,q,i,j,s,t)$$

$$- \frac{1}{2L_{0,0}^{(f)}} \sum_{\substack{i=0 \\ i+j<p+q}}^{p} \sum_{j=0}^{q} I(i,j)^{(f)} \sum_{i'=0}^{p-i} \sum_{j'=0}^{q-j} L_{i',j'}^{(f)} \sum_{s'=0}^{p-i-i'} \sum_{t=0}^{q-j-j'} L_{s,t}^{(h)} \sum_{s=i'+s'}^{p-s} \sum_{t=j'+t'}^{q-t} A(s,t,i',j',s',t') A(p,q,i,j,s,t)$$

$$= \frac{1}{2L_{0,0}^{(f)}} \sum_{\substack{i=0 \\ i+j<p+q}}^{p} \sum_{j=0}^{q} I(i,j)^{(f)} \sum_{i'=0}^{p-i} \sum_{j'=0}^{q-j} L_{i',j'}^{(f)} \sum_{s=0}^{p-i-i'} \sum_{t=0}^{q-t} L_{s,t}^{(h)} \sum_{s'=i+i'}^{p-s} \sum_{t'=j+j'}^{} A(s',t',i,j,i',j') A(p,q,s',t',s,t)$$

$$- \frac{1}{2L_{0,0}^{(f)}} \sum_{\substack{i=0 \\ i+j<p+q}}^{p} \sum_{j=0}^{q} I(i,j)^{(f)} \sum_{i'=0}^{p-i} \sum_{j'=0}^{q-j} L_{i',j'}^{(f)} \sum_{s=0}^{p-i-i'} \sum_{t=0}^{q-j-j'} L_{s,t}^{(h)} \sum_{s'=i'+s}^{p-i} \sum_{t'=j+t}^{q-j} A(s',t',i',j',s,t) A(p,q,i,j,s',t')$$

$$= \frac{1}{2L_{0,0}^{(f)}} \sum_{\substack{i=0 \\ i+j<p+q}}^{p} \sum_{j=0}^{q} I(i,j)^{(f)} \sum_{i'=0}^{p-i} \sum_{j'=0}^{q-j} L_{i',j'}^{(f)} \sum_{s=0}^{p-i-i'} \sum_{t=0}^{q-j-j'} L_{s,t}^{(h)} T(p,q,i,j,i',j',s,t)$$

$$\text{(A25)}$$

where

$$T(p,q,i,j,i',j',s,t) = \sum_{s'=i+i'}^{p-s} \sum_{t'=j+j'}^{q-t} A(s',t',i,j,i',j') A(p,q,s',t',s,t)$$

$$- \sum_{s'=i'+s}^{p-i} \sum_{t'=j'+t}^{q-j} A(s',t',i',j',s,t) A(p,q,i,j,s',t') \quad \text{(A26)}$$

Using (A19), we have
$$T(p,q,i,j,i',j',s,t)$$

$$= \sum_{s'=i+i'}^{p-s} \sum_{t'=j+j'}^{q-t} \sum_{k'=i}^{s'-i'} \sum_{m'=k'+i'}^{s'} \sum_{l'=j}^{t'-j'} \sum_{n'=l'+j'}^{t'} \binom{m'}{k'}\binom{n'}{l'} c_{s',m'} c_{t',n'} d_{k',i} d_{m'-k',i'} d_{l',j} d_{n'-l',j'}$$
$$\times \sum_{k=s'}^{p-s} \sum_{m=k+s}^{p} \sum_{l=t'}^{q-t} \sum_{n=l+t}^{q} \binom{m}{k}\binom{n}{l} c_{p,m} c_{q,n} d_{k,s'} d_{m-k,s} d_{l,t'} d_{n-l,t}$$

$$- \sum_{s'=i'+s}^{p-i} \sum_{t'=j'+t}^{q-j} \sum_{k'=i'}^{s'-s} \sum_{m'=k'+s}^{s'} \sum_{l'=j'}^{t'-t} \sum_{n'=l'+t}^{t'} \binom{m'}{k'}\binom{n'}{l'} c_{s',m'} c_{t',n'} d_{k',i'} d_{m'-k',s} d_{l',j'} d_{n'-l',t}$$
$$\times \sum_{k=i}^{p-s'} \sum_{m=k+s'}^{p} \sum_{l=j}^{q-t'} \sum_{n=l+t'}^{q} \binom{m}{k}\binom{n}{l} c_{p,m} c_{q,n} d_{k,i} d_{m-k,s'} d_{l,j} d_{n-l,t'}$$

$$= \sum_{s'=i+i'}^{p-s} \sum_{k'=i}^{s'-i'} \sum_{m'=k'+i'}^{s'} \sum_{k=s'}^{p-s} \sum_{m=k+s}^{p} \binom{m'}{k'}\binom{m}{k} c_{s',m'} d_{k',i} d_{m'-k',i'} c_{p,m} d_{k,s'} d_{m-k,s}$$
$$\times \sum_{t'=j+j'}^{q-t} \sum_{l'=j}^{t'-j'} \sum_{n'=l'+j'}^{t'} \sum_{l=t'}^{q-t} \sum_{n=l+t}^{q} \binom{n'}{l'}\binom{n}{l} c_{t',n'} d_{l',j} d_{n'-l',j'} c_{q,n} d_{l,t'} d_{n-l,t}$$

$$- \sum_{s'=i'+s}^{p-i} \sum_{k'=i'}^{s'-s} \sum_{m'=k'+s}^{s'} \sum_{k=i}^{p-s'} \sum_{m=k+s'}^{p} \binom{m'}{k'}\binom{m}{k} c_{s',m'} d_{k',i'} d_{m'-k',s} c_{p,m} d_{k,i} d_{m-k,s'}$$
$$\times \sum_{t'=j'+t}^{q-j} \sum_{l'=j'}^{t'-t} \sum_{n'=l'+t}^{t'} \sum_{l=j}^{q-t'} \sum_{n=l+t'}^{q} \binom{n'}{l'}\binom{n}{l} c_{t',n'} d_{l',j'} d_{n'-l',t} c_{q,n} d_{l,j} d_{n-l,t'}$$

$$= F(p,i,i',s)F(q,j,j',t) - G(p,i,i',s)G(q,j,j',t) \quad \text{(A27)}$$

where $F(p,i,i',s)$ and $G(p,i,i',s)$ are respectively given by (A1) and (A2).

Using Lemma 2, we have
$$T(p,q,i,j,i',j',s,t) = 0 . \quad \text{(A28)}$$

Thus
$$I(p,q)^{(g)} - I(p,q)^{(f)} = 0 \quad \text{(A29)}$$

The proof of Theorem 3 has been completed. □

Appendix B: LIST OF LEGENDRE MOMENT INVARIANTS UP TO THE SEVENTH ORDER

The expressions given below provide to the interested readers all the elements to replicate our method and to apply it to other examples.

- Third order

$$\bar{I}(3,0) = \bar{L}_{30}$$
$$\bar{I}(2,1) = \bar{L}_{21}$$
$$\bar{I}(1,2) = \bar{L}_{12}$$
$$\bar{I}(0,3) = \bar{L}_{03}$$

- Fifth order

$$\bar{I}(5,0) = \bar{L}_{50} - \frac{3\sqrt{77}}{2}\bar{L}_{30} - \frac{3\sqrt{385}\bar{L}_{20}\bar{L}_{30}}{5\bar{L}_{00}}$$

$$\bar{I}(4,1) = \bar{L}_{41} - \frac{7\sqrt{5}}{2}\bar{L}_{21} - \frac{1}{\bar{L}_{00}}(7\bar{L}_{21}\bar{L}_{20} + \sqrt{21}\bar{L}_{11}\bar{L}_{30})$$

$$\bar{I}(3,2) = \bar{L}_{32} - \frac{5}{6}\sqrt{21}\bar{L}_{12} - \frac{\sqrt{5}}{2}\bar{L}_{30} - \frac{1}{\bar{L}_{00}}\left(\frac{\sqrt{105}}{3}\bar{L}_{20}\bar{L}_{12} + \frac{5\sqrt{21}}{3}\bar{L}_{11}\bar{L}_{21} + \bar{L}_{02}\bar{L}_{30}\right)$$

$$\bar{I}(2,3) = \bar{L}_{23} - \frac{5}{6}\sqrt{21}\bar{L}_{21} - \frac{\sqrt{5}}{2}\bar{L}_{03} - \frac{1}{\bar{L}_{00}}\left(\frac{\sqrt{105}}{3}\bar{L}_{02}\bar{L}_{21} + \frac{5\sqrt{21}}{3}\bar{L}_{11}\bar{L}_{12} + \bar{L}_{20}\bar{L}_{03}\right)$$

$$\bar{I}(1,4) = \bar{L}_{14} - \frac{7\sqrt{5}}{2}\bar{L}_{12} - \frac{1}{\bar{L}_{00}}(7\bar{L}_{12}\bar{L}_{02} + \sqrt{21}\bar{L}_{11}\bar{L}_{03})$$

$$\bar{I}(0,5) = \bar{L}_{05} - \frac{3\sqrt{77}}{2}\bar{L}_{03} - \frac{3\sqrt{385}\bar{L}_{02}\bar{L}_{03}}{5\bar{L}_{00}}$$

- Seventh order

$$\bar{I}(7,0) = \bar{L}_{70} - \frac{1727\sqrt{105}}{120}\bar{L}_{30} - \frac{13\sqrt{165}}{6}\bar{I}(5,0)$$
$$- \frac{1}{\bar{L}_{00}}\left(\frac{1595\sqrt{21}}{42}\bar{L}_{20}\bar{L}_{30} + \frac{143\sqrt{105}}{35}\bar{L}_{40}\bar{L}_{30} + \frac{13\sqrt{33}}{3}\bar{L}_{20}\bar{I}(5,0)\right)$$

$$\bar{I}(6,1) = \bar{L}_{61} - \frac{351\sqrt{65}}{40}\bar{L}_{21} - \frac{11\sqrt{13}}{2}\bar{I}(4,1) - \frac{1}{\bar{L}_{00}}\left(\frac{45\sqrt{13}}{2}\bar{L}_{20}\bar{L}_{21} + \frac{11\sqrt{65}}{5}\bar{L}_{40}\bar{L}_{21}\right.$$
$$\left. + \frac{109\sqrt{273}}{30}\bar{L}_{11}\bar{L}_{30} + \frac{33\sqrt{13}}{5}\bar{L}_{31}\bar{L}_{30} + \frac{11\sqrt{65}}{5}\bar{L}_{20}\bar{I}(4,1) + \frac{\sqrt{429}}{3}\bar{L}_{11}\bar{I}(5,0)\right)$$

$$\bar{I}(5,2) = \bar{L}_{52} - \frac{119\sqrt{33}}{24}\bar{L}_{12} - \frac{3\sqrt{385}}{4}\bar{L}_{30} - \frac{3\sqrt{77}}{2}\bar{I}(3,2) - \frac{\sqrt{5}}{2}\bar{I}(5,0)$$
$$- \frac{1}{\bar{L}_{00}}\left(\frac{73\sqrt{165}}{30}\bar{L}_{20}\bar{L}_{12} + \sqrt{33}\bar{L}_{40}\bar{L}_{12} + \frac{73\sqrt{33}}{6}\bar{L}_{11}\bar{L}_{21} + 3\sqrt{77}\bar{L}_{31}\bar{L}_{21} + \frac{3\sqrt{77}}{2}\bar{L}_{02}\bar{L}_{30}\right.$$

H. ZHANG was born in 1981. He received the B.S. degree in Radio Engineering in 2003 and Ms. Degree in Biomedical Engineering in 2006 from Southeast University, respectively. He is currently pursuing the Ph.D. degree in the Department of Computer Science of Southeast University. His research interest is mainly focused on pattern recognition and image processing.

H.Z. Shu (M'00-SM'06) received the B.S. Degree in Applied Mathematics from Wuhan University, China, in 1987, and a Ph.D. Degree in Numerical Analysis from the University of Rennes (France) in 1992. He is now with the Department of Computer Science and Engineering of Southeast University, China. His recent work concentrates on the image analysis, pattern recognition, and fast algorithms of digital signal processing. Dr. Shu is a senior member of IEEE.

G.N. Han received the B.S. Degree in Applied Mathematics from Wuhan University, China, in 1987, and a Ph.D. Degree in Mathematics from the University of Strasbourg I (France) in 1992. He works as research associate at French National Center for Scientific Research (CNRS) since 1993.

G. Coatrieux (M'06) received the Ph. D. degree in signal processing and telecommunication from the University of Rennes I, Rennes, France, in collaboration with the Ecole Nationale Supérieure des Télécommunications, Paris, France, in 2002. His Ph. D. focused on watermarking in medical imaging. He is currently an Associate Professor in the Information and Image Processing Department, Institut TELECOM—TELECOM Bretagne, Brest, France, and his research is conducted in the LaTIM Laboratory, INSERM U650, Brest. His primary research interests concern medical information system security, watermarking, electronic patient records, and healthcare knowledge management.

L.M. Luo (M'90-SM'97) obtained his Ph.D. Degree in 1986 from the University of Rennes (France). Now he is a professor of the Department of Computer Science and Engineering of Southeast University, China. His current research interests include medical imaging, image analysis, computer-assisted systems for diagnosis and therapy in medicine, and computer vision. Dr. Luo is a senior member of the IEEE. He is an associate editor of IEEE Engineering in Medicine and Biology Magazine and Innovation et Technologies en Biologie et Medicine (ITBM).

J.L. Coatrieux (M'84-SM'89-Fellow'94) received the Ph.D. and State Doctorate in Sciences in 1973 and 1983, respectively, from the University of Rennes 1, Rennes, France. Since 1986, he has been Director of Research at the National Institute for Health and Medical Research (INSERM), France, and since 1993 has been Professor at the New Jersey Institute of Technology, USA. He is also Professor at Telecom Bretagne, Brest, France. He has been the Head of the Laboratoire Traitement du Signal et de l'Image, INSERM, up to 2003. His experience is related to 3D images, signal processing, pattern recognition, computational modeling and complex systems with applications in integrative biomedicine. He published more than 300 papers in journals and conferences and edited many books in these areas. He has served as the Editor-in-Chief of the IEEE Transactions on Biomedical Engineering (1996-2000) and is in the Boards of several journals. Dr. Coatrieux is a fellow member of IEEE. He has received several awards from IEEE (among which the EMBS Service Award, 1999, the Third Millennium Award, 2000 and the EMBS Career Achievement Award, 2006) and he is Doctor Honoris Causa from the Southeast University, China.

Table 1. The recognition rates obtained respectively with GMI, CMI and LMI for alphanumeric character in Fig. 7

	GMI	CMI	LMI
Noise-free	100%	100%	100%
Additive white noise with STD=1	92.08%	91.88%	100%
Additive white noise with STD=3	85%	82.92%	97.71%
Additive white noise with STD=5	77.29%	75.42%	90%
Additive salt-and-pepper noise with noise density = 0.2%	91.04%	87.08%	97.92%
Additive salt-and-pepper noise with noise density = 0.4%	83.75%	83.54%	94.79%
Additive salt-and-pepper noise with noise density = 0.8%	77.33%	75.67%	90%
Additive multiplicative noise with noise density = 0.01	95.83%	90.63%	98.13%
Additive multiplicative noise with noise density = 0.03	95%	86.88%	97.5%
Additive multiplicative noise with noise density = 0.05	91.25%	85.21%	95%
Computation time	6.86s	27.08s	6.95s

Table 2. The recognition rates of the GMI, CMI and LMI in object recognition (Fig. 9)

	GMI	CMI	LMI
Noise-free	100%	100%	100%
Additive white noise with STD=8	78.33%	80%	96.25%
Additive white noise with STD=16	68.96%	62.71%	83.96%
Additive white noise with STD=25	60.42%	50.62%	74.79%
Additive salt-and-pepper noise with noise density = 0.01	87.29%	76.46%	97.08%
Additive salt-and-pepper noise with noise density = 0.02	73.33%	64.38%	85.83%
Additive salt-and-pepper noise with noise density = 0.03	68.13%	56.46%	79.37%
Additive multiplicative noise with noise density = 0.1	100%	99.17%	100%
Additive multiplicative noise with noise density = 0.3	96.25%	87.92%	99.38%
Additive multiplicative noise with noise density = 0.5	90%	81.88%	95.63%
Computation time	9.42s	44.14s	9.80s

Table 3. GMI CMI and LMI values of the real images in Fig. 10

	Image1	Image2	Image3	Image4	Image5	Image6	Image7	Image8	σ/μ
$\bar{G}(5,0)$	-0.328	-0.319	-0.324	-0.322	-0.324	-0.329	-0.357	-0.363	5.07%
$\bar{C}(5,0)$	35.01	34.95	34.51	34.34	34.38	34.44	40.28	40.62	7.54%
