

# KNOTS in $S^3$

projection

under-overcrossing?!

declare  $\textcircled{X} = X$

plane field  
(standard ctcd structure)

• Legendrian knots:

slope in  $\mathbb{R}^2_{(x,y)}$  = height "z"  $\left(\frac{\partial y}{\partial x} = z\right)$

Q1:  $L$  &  $L'$  Legendrian knots

$$L \stackrel{\text{isot}}{\sim} L' \stackrel{?}{\iff} L \stackrel{\text{Leg}}{\underset{\text{isot}}{\sim}} L'$$

$\Leftarrow$  ✓

$\Rightarrow$  ✗ simplest example:

How do we distinguish Legendrian knots?

- Invariants:
  - Thurston-Bennequin #  
 $L \mapsto tb(L) \in \mathbb{Z}$
  - rotation #  
 $L \mapsto r(L) \in \mathbb{Z}$

Q2  $L, L'$  Leg knot  $L \stackrel{isot}{\sim} L'$   
 $tb(L) = tb(L')$   $r(L) = r(L')$   $\Rightarrow L \stackrel{Leg}{\sim}_{isot} L'$  ?

- unknot (Eliashberg) ✓
- figure eight & torus knots (Etnyre - Honda) ✓

But! not all knots! simplest example:  $(tb=1, r=0)$

twist knots (Epstein - Fuchs - Meier)

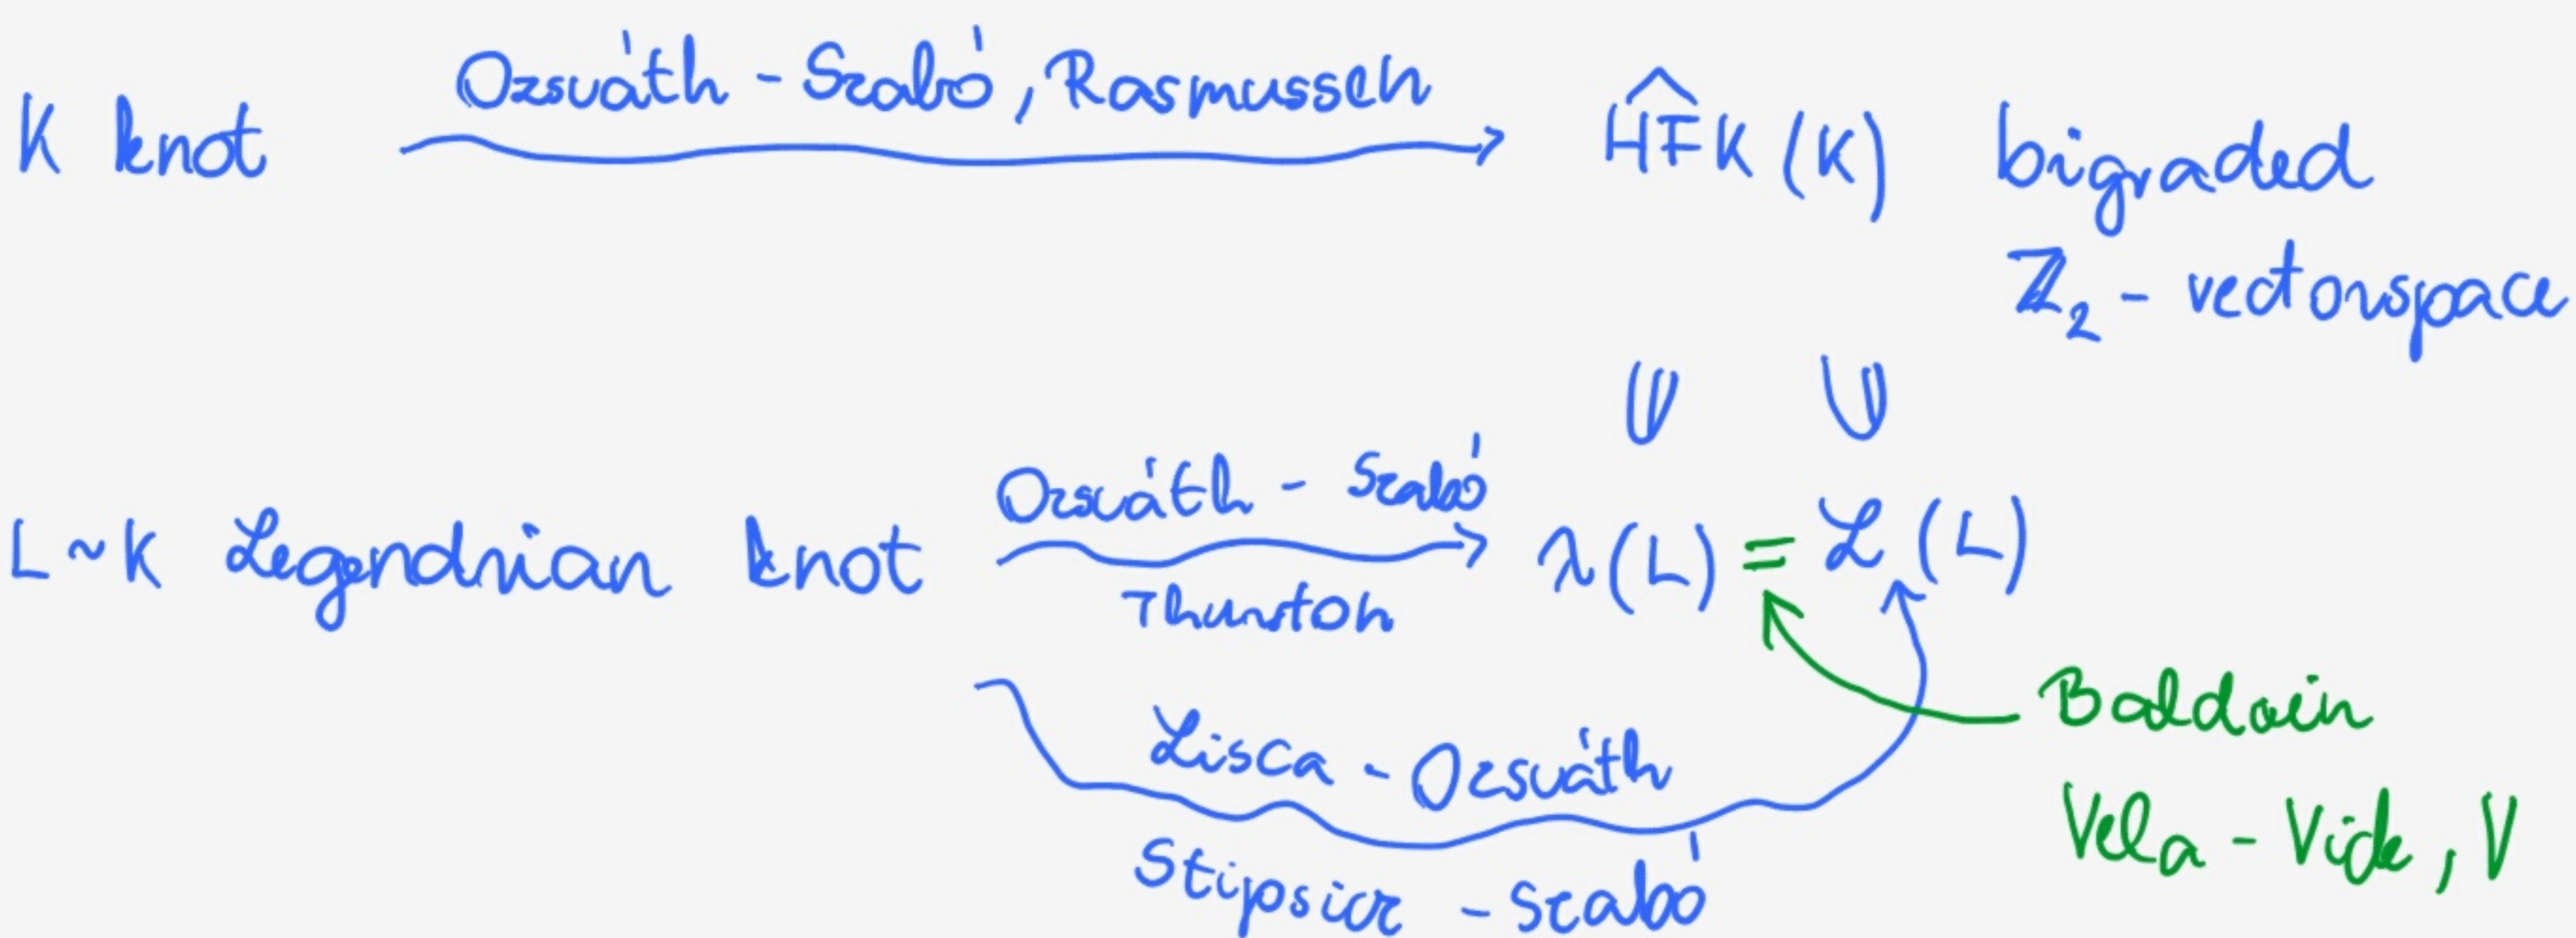

~~Leg isot~~

RE: (Etnyre - Ng - V)  
 complete classification  
 of all twist knots

• more invariants:

- Legendrian contact homology
- Heegaard Floer homology

- generalises Alexander polynomial
- detects knot-genus (Ozsváth - Szabó)
- fiberedness (Ghiggini, Ni)
- bounds slice-genus (Ozsváth, Szabó)

Computing: (defined using PDE)

Peterson - V: computing HFk from pieces
